THE WORLD FINANCIAL MARKET

For centuries, the Global Financial Market organizations have created a way to extract positive results for themselves. These organizations absorb and collect most of the money that enters the market, in such a way that the Market has been parasitized, manipulated, all around, either by financial institutions or the states, or both.

WHO ARE THE MEGA CAPITALISTS?

Mega capitalists include giant institutions and besides what's said, they do not care about you: small investor. According to a survey carried out recently by the Zurich Federal Institute of Technology, Switzerland, it turns out that over 100 companies dominate almost half of all the world's capital, and around 50 have an intense performance in the market and stock exchanges.

We can include conglomerates such as: Coldman Sachs, Barclays, Bank of América, Capital Group Companies Inc., FMR Corporation, AXA, Citibank, State Street Corporation, JP Morgan Chase, Legal and General Group, Vanguard Group, and UBS.

At the top of the pyramid, there is a concentration of a lot of money, in the hands of very few players/negotiators and below that, at the base, we find the small investors, the large number of people with just a little money.

HOW DOES THE MARKET WORK?

Let's think about pizza slices. To increase the size of a slice, it's needed to reduce someone's else slice. The money is already circulating in the market and certain moments, it changes hands.

The biggest players have the power, informations, influence and they are consuming the money from the Central Banks, the retail investment fund, and consequently your money, and beyond that, they acquire the highest technology to do so.

MAN X MACHINE

Man versus Machine is something fascinating. Besides saving us from starving, machines can transform us into a Superman. It gives us speed, efficiency, and can even make us fly. The plot twist happens when a man + machine turns into a man x machine.

And, casually taking this article to an apocalyptic scenery where human survival is threatened by our cold creations without a heart, we want to talk about something real that is happening at this very moment.

Have you ever thought about what are your chances against high technology machines acting in the financial markets?

THE HIGH FINANCIAL TECHNOLOGY

These machines we refer to are called HFTS (High-Frequency Negotiating) and they are super automated robots or high-frequency trade machines. The most well-paid people on the planet are those who can create this kind of technology.

WHAT ARE YOUR CHANCES AGAINST HIGH TECHNOLOGY MACHINES ACTING IN THE FINANCIAL MARKETS?

Robots/machines include an ultra-modern software built-in, it works for one goal: take advantage of every, any inefficiency or opportunity to earn money in the market as they are programmed to extract money from it.

The first HFT's were made in the United States at the end of the '90s, the machines could operate in the frequency of milliseconds.

Nowadays the operation of these machines has grown in every stock exchange. According to the last estimate, more than 80% of businesses in the financial market are made by HFT's. Do you have any idea what it means? From every 1,000 businesses in the stock, more than 800 are done by high-frequency robots. Taking into consideration this irrational number, and the fact that few people have access to this kind of technology, we can conclude 4 important facts:

When you lose money in the market, this money is expected to go to a big financial institution, that can pay for the HFT's.

01

These wonderful technologies are developed with high-quality technology, with years of research, millions of dollars, and time invested in programming the hardware.

It is a sophisticated technology capable of getting hold of any minor change from the microstructure in the market and it can execute lots of orders by little seconds, making good profits, in such a way, they are unnoticed by big investors.

The probability of being equal with this super automated robots is zero, people lose and earn every day in the stocks around the world.

02

However the researches have shown that investors lose more than earn, and the only way of getting out of it is being on equal footing with those giants and you might ask yourself: how can I do it as a small investor?

03

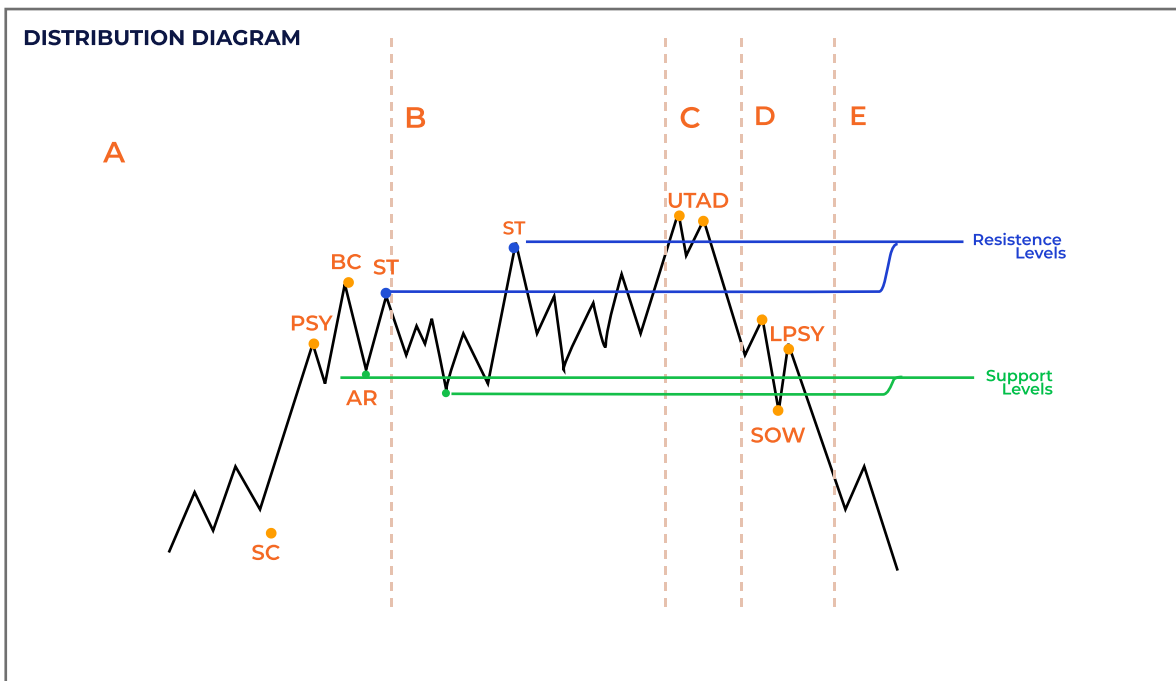

This is exactly the most powerful strategy in the world financial market, this article is clear for all, this topic is bigger in the Bitcoin market, this is the Modus Operandi, that big financial institutions use to accumulate assets when low and to distribute them when prices rise.

04

Check next two diagrams that reveal the principle of working of these great players. According to the methodology developed by Richard Wyckoff, who is an expert in this subject and is known as well as Charles H. Dow and Ralf N. Elliott.

WHERE THE BITCOIN COMES IN THE STORY

When Satoshi Nakamoto wrote the “whitepaper” which originated the Bitcoin, his primary dream was to reinvent the money, removing power from most world bankers and allowing any person on the planet of having or being its “own bank”.

But the multi-billionaire Bitcoin market wouldn’t come unnoticed by the “institutional whales” and to strive between them, on the opposite are “native whales” from Bitcoin, who are the billionaires from this segment, they left the first place and are in an unceasing race to accumulate more and more bitcoins.

Those have also armed themselves from this technology apparatus due to their economic power and with heavy artillery, are fighting against financial institutional sharks that are already in the Bitcoin market.

What we are facing at this moment is a real robot battle to accumulate Bitcoins.

WHO ARE THESE BIG PLAYERS?

They are the famous whales that make daily use of HFT's in the stock, including the most exchanges of Bitcoin, and the problem of those big players is not money, and they learn how to earn more. The issue HFT's solves for them is the liquidity.

Simply because their orders have giants volume and for them to invoice those orders it has to be distributed in a way to find common people betting on the other side?

HOW ALL OF THIS WORKS

It is important to understand that the institutional investors, the "big whales", have different problems comparing to common people, the problem of big players is to find people or brave institutions to buy, when one of the giants is on sale or how to find people or institution willing enough to sell when one of those giants wish to buy.

That's when the HFT's enters, they aim to find liquidity, to make the best negotiations possible and if there is no liquidity, they make it.

HOW DO THE WHALES MAKE THAT?

Something that will be revealed now is the secret information about strategies of how the markets are manipulated by those giant whales through the most powerful HFT's and how you can protect yourself and even benefit from this situation.

A) SPOOFING

Let's take an example of the global bitcoin market. Buyers and sellers send their orders through exchanges. These orders are recorded in the order book. Let's say that the last BITCOIN price was negotiated at U \$ 17,500.00 and a seller may wish to sell 1 bitcoin at U \$ 17,510.00 this is recorded in the order book.

A HFT robot can position and reposition a sales order of 1,000 BITCOINS at U \$ 17,450.00 and this would force other participants to practice lower and lower prices. For example, at U \$ 17,449.00 so as not to lose the turn in the queue, after all that gigantic order would exhaust all liquidity in that price range.

The queue in the order book is not formed on a first-come, first-served basis, but at the best prices, whether buying or selling, and the best buying or selling prices will be executed beforehand. These gigantic orders are repeated several times and attracting prices to certain lower and lower regions. However, the HFT robot did not want to sell, in fact, what he wanted was to put the price lower and lower to be able to buy. But only when the price reached U \$ 17,400.00, for example.

The name of this practice is SPOOFING and is prohibited, the first cases have already been punished by Organs regulatory bodies, despite this, this practice occurs hundreds and thousands of times daily.

B) ICEBERG ORDERS

Another example of HFT's is the iceberg orders. For example, if the institutional investor (big player) active in the Bitcoin market wants to buy 10.000 Bitcoins, he will struggle to get this amount without moving its quotation, according to the supply and demand offer, this big quantity would certainly cause a high in the prices.

The HFT's robots can be programmed with a buying plan for Bitcoins, at a certain price, however with small quantities.

It buys 5 Bitcoins, then it renews the offer with more 5 Bitcoins and so on. Nobody knows how many times this will be done, only the institutional investor knows he needs to buy 10.000 Bitcoins.

Thus the market doesn't get euphoric and does not go up intensively. The purchase will be shared into many parts and everybody only see the iceberg's peak, therefore these orders receive the name of iceberg orders.

THE DESTRUCTION OF SMALL INVESTORS IS PROGRAMMED

The HFT's robots can buy for the lowest price and sell for the highest without calling no market's attention. Both to execute orders secretly as to position orders and cancel them in milliseconds before they come true. This without human interference and millions of times a day.

This kind of mechanism is extremely complex and it is for sure a piece of silent information.

Remember that we are talking about institutions that have annual revenues higher than the GDP(gross domestic product) of many countries, having information like this would be like stealing secret information from a powerful government.

However, we can be sure that the main problem the automated systems HFT's need, is to solve their liquidity and the necessity of getting it, the HFT's systems, even with no intention end up leaving traces.

THE GOOD NEWS IS THAT TRACES HAD BEEN MAPPED AND IDENTIFIED

Over the past five years an anonymous group of developers, traders and programmers from around the world, for example, Satoshi Nakamoto, got together and started tracking, identify and finally code the traces left by powerful automated HFT's systems managing to understand the entire architecture of the system's operation and by mapping their source code they created a compact and 100% system similar to the powerful HFTs.

The surprising thing is that they managed to improve the performance of this system in a specific way for the global Bitcoin market which, unlike any other asset, presents odd volatility.

This system was called DexBTCio. It uses a "weight" balancing system with the main known indicators, where the highlight is the volume indicators that, once identified, generate orders through an unprecedented system of "fractals" in a matter of seconds working in a 100% way automatic.

DexBTC.io® is a system that works within the largest bitcoin futures brokers in the world: BitMEX, Deribit, Binance Futures, Okex and Bybit, this system is able to put ordinary people on an equal footing with the major players in the world market 100% automatically and 100% safe.

✓ 100% automatic because once rented on your brokerage account it will work through API & # 39s provided by the brokerage firms without doing anything at all and you will be able to follow the direct operations on your account in real-time and also through the DexBTCio dashboard.

✓ 100% secure because it's right into your account, right into your pocket, the custody of your Bitcoins will always be in your power, you will always be in total control of your resources being able to withdraw, transfer, or simply account for daily profits.

"Satoshi created bitcoin, now we are going to multiply it!"

TRUE PROFITABILITY

DexBTC.io's profitability is obviously linked to market volatility and therefore variable, but we do the metric every month and on the daily average of the platform in 2020 the system is currently generating an incredible 0.7597585453% per day.

And more, if DexBTC.io was not enough to offer this fantastic daily profitability, both your profits and your capital will always be 100% under your control.

HOW TO START

1 Go to DexBTC.io

2 Tap the  button

3 Sign up

4 Plug into your BitMEX account through the APIs
Make sure you have positive balance

5 Start profiting!
